What is the reason for this change in the usual pattern of aging? The evidence is overwhelming that the life extension results from a slowing of aging processes. And the factor responsible is the decrease in caloric intake. The obvious question: How does this factor work? A good question - and the reason that research on the anti-aging action of caloric restriction is today one of the most studied research areas in biological gerontology. For it is felt that if the biological mechanisms of the anti-aging action of caloric restriction can be uncovered, we would gain an understanding of the basic nature of aging processes, which would, in turn, yield possible interventions in human aging. This book aims to

provide the growing number of researchers in this field (faculty, postdoctoral trainees, and graduate students) with a detailed knowledge of what is known about caloric restriction within the frame of gerontology, as well as insights on future of this field.

*Key Environments: Madagascar* Feb 05 2021 In the forests of Madagascar, about nine-tenths of the plant and animal species are unique to the island. Their natural habitats range from true rainforest to the lunar landscape of the spiny desert, and the natural rock-gardens of the mountain tops. Madagascar is no oceanic island, but a fragment of continent a thousand miles long, wrenched loose from the side of Africa. In this Lost World, plants and animals have become a living museum of evolution. Aepornis, the largest bird which ever lived, became extinct on Madagascar in the last few hundred years. Many more Malagasy species are now following Aepornis into extinction. This volume introduces Madagascar's unique fauna and flora to general readers - the first such handbook available in English, and the first book to combine

articles by Malagasy, French, English and American scientists, writing in their own fields of expertise.

**Molecular Beam Epitaxy** Dec 03 2020 In this volume, the editor and contributors describe the use of molecular beam epitaxy (MBE) for a range of key materials systems that are of interest for both technological and fundamental reasons. Prior books on MBE have provided an introduction to the basic concepts and techniques of MBE and emphasize growth and characterization of GaAs-based structures. The aim in this book is somewhat different; it is to demonstrate the versatility of the technique by showing how it can be utilized to prepare and explore a range of distinct and diverse materials. For each of these materials systems MBE has played a key role both in their development and application to devices.

*Red Sea* Aug 23 2022 The Red Sea is a unique and fragile environment. All but landlocked between Africa and Arabia, its peculiar oceanographic conditions, its geographical position and its geological history all conspire to make it particularly vulnerable to the side-effects of human civilization. In places, it is already a key environment under threat. What makes the Red Sea unique? What are the threats to this environment? Where should future research be directed? These are just three of the major questions addressed by the scientists contributing to this book.
